ANNUAL REPORT 1985-1986

**Dauphin Island Sea Lab  
Dauphin Island, Alabama 36528**

Directors Preface:

The year which started with such promise represented by the arrival of the R/V A. E. Verrill and the hiring of two new faculty has been flawed by the impact of proration, budget reductions for next year and more proration threats. It is difficult to maintain momentum without fuel and enthusiasm. Luckily, MESC never seems to lack enthusiasm. The obstacles always seem surmountable and we enter a new year with an exciting academic program featuring new courses, new research initiatives, a functional vessel operations program, a growing graduate student population and a largely positive attitude from a successful and productive year.

New contacts have been made with the state's educational community and productive programs have evolved with the Dept. of Economic and Community Affairs. The Executive Committee has begun a more active involvement and organizational maturity is more evident than ever before. The movement toward academic achievement, which began this year, will be greatly assisted by this stability and commitment.

## MARINE ENVIRONMENTAL SCIENCES CONSORTIUM

ANNUAL REPORT 1985-1986

### PERSONNEL CHANGES:

Within the laboratory, Dr. Judy Stout was promoted to full Director of the Sea Lab while Mike Dardeau was promoted to Staff Biologist with primary responsibility for the scientific collections. With May Spaulding's shift to auxiliary services, Georgia Mallon has become comptroller and business manager while Lynn Bryant has assumed the duties of bursar.

Two faculty have been hired and joined the lab late in the summer. Dr. Kenneth Heck, formerly the Director of the Patrick Center for Environmental Studies at the Philadelphia Academy of Science, has accepted the permanent line item. Dr. Heck has been given a tenure-earning appointment at USA. Dr. Donald Stearns, a 1983 graduate of Duke, was chosen for the two-year post-doctoral position. Dr. Stearns is a zooplankton expert who should help us fill that data gap for the coastal ecosystem.

### FACILITIES

The hurricane repairs were completed during the final week of the summer session with the delivery of furniture to Challenger Hall. A new roof design has been employed in an effort to minimize future storm damage.

Modest alterations to the former recreation hall included new stairs and the conversion to a teaching facility will continue. The facility is designed to support the geology classes, and provide general purpose instruction. We anticipate full-time usage next summer.

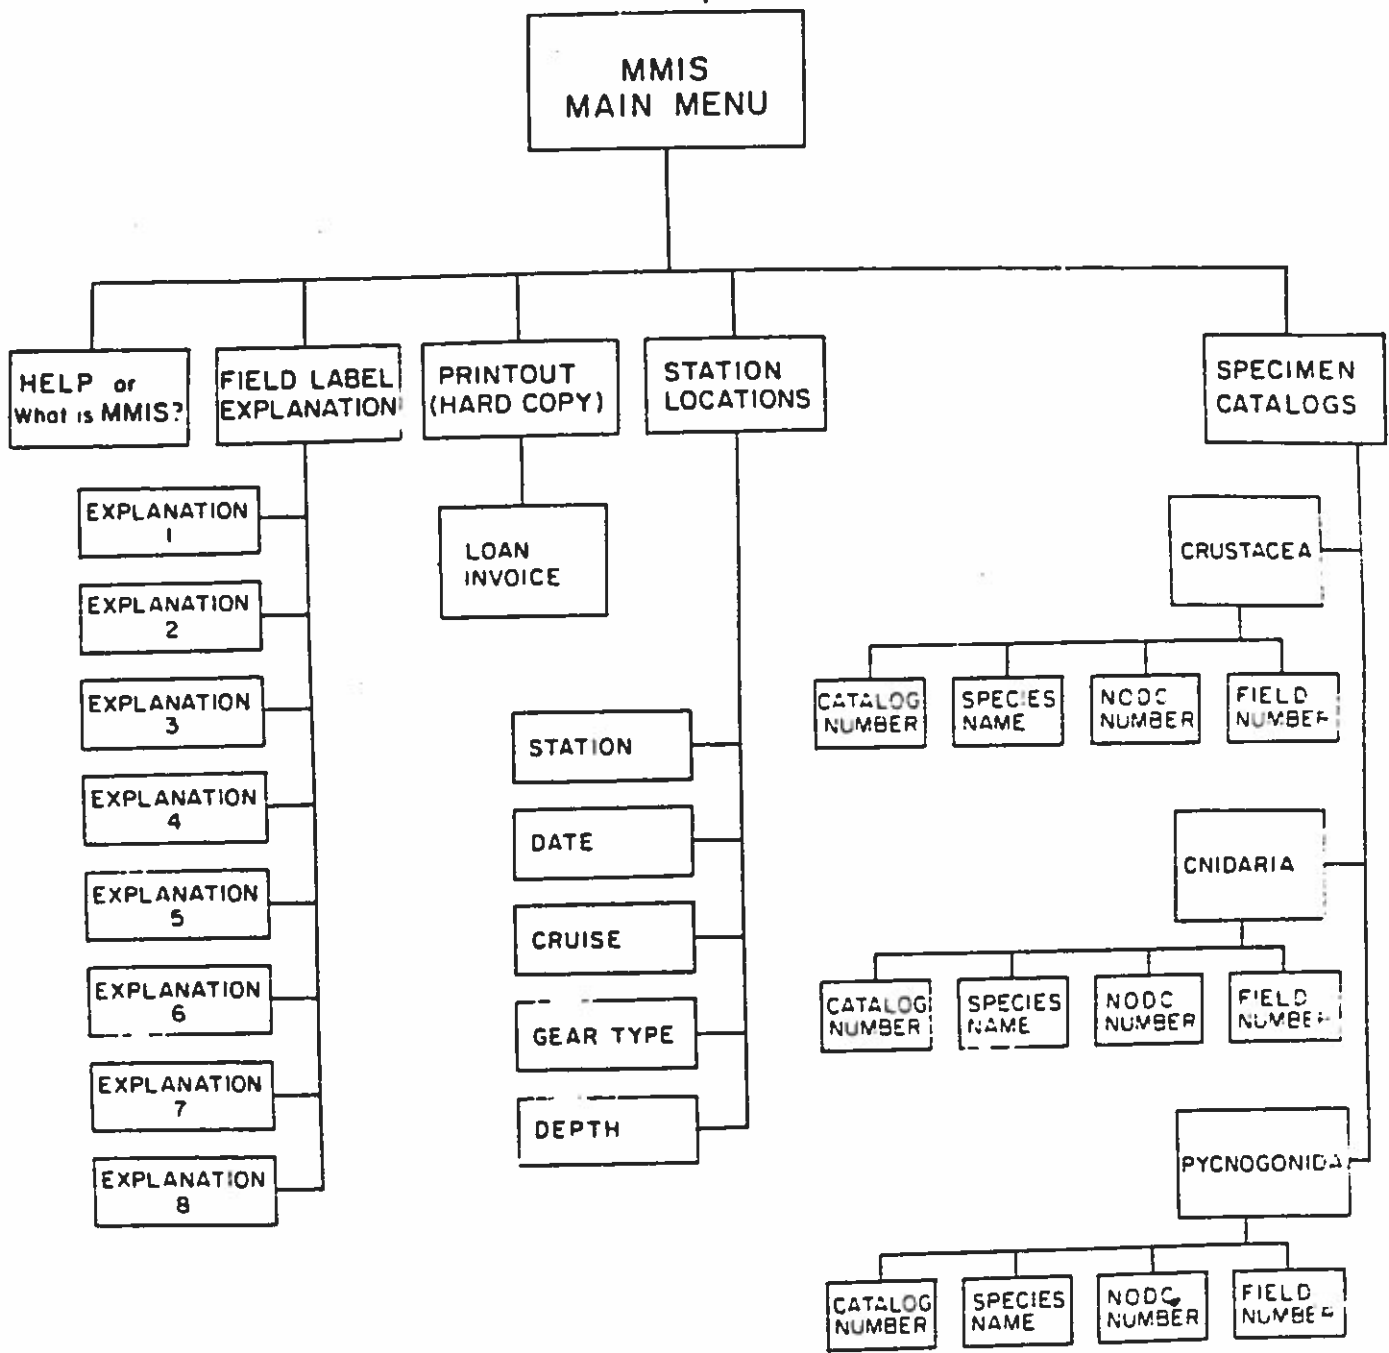

computer terminal. An example of a partial species list with associated data is shown in (Figure 2). These programs also facilitate the preparation of loan invoices (Figure 3).

Data is transferred to computer files as cataloging is completed. To date, all Cnidaria (1820 lots, 76 species, 6173 specimens), Pycnogonida (107 lots, 12 species, 228 specimens) and most Crustacea (over 10,000 lots, over 34,000 specimens) data are accessible by computer. Entry of the Mollusca data (approximately 7,000 lots) and Echinodermata data (approximately 3000 lots) will continue in the coming year.

The museum was designated the repository for benthic invertebrates collected during the study "Benthic Macroinfauna Community Characterizations in Mississippi Sound and Adjacent Areas" sponsored by the U.S. Army Corps of Engineers. The majority of the specimens was transferred to MESC in 1983 and was followed by a voucher collection numbering over 100 species in 1984.

Twenty-five loans and gifts, totaling over 600 lots were made in 1983-86. The largest loan, 278 lots of barnacles, was made to Dr. Victor Zullo of UNCC for taxonomic and ecological research. A gift of note was the presentation of a large, preserved collection of local vertebrates and invertebrates to the Exploreum, a Mobile based science museum.

A listing of nearly 50 publications on invertebrate systematics can be found in Appendix 1. These publications are either based on material from the MESC Museum, material collected by MESC personnel, or were completed by the author while in residence at MESC.

## LIBRARY

The library has continued to grow (Table 1) and function has been maintained. Ms. Connie Mallon and Ms. Randy Horton attended a seminar on computerizing library holdings and that process has begun.

## INSTRUCTION

Despite the hurricane season, the tradition of year-round instruction has been preserved. During the fall quarter Dr. Stout taught Marsh Ecology to six graduate students. She then held a readings course in Sea Grass Ecology while teaching Human Genetics for the biology department at USA, during the winter quarter. Also in the winter Dr. Shipp taught Marine Zoogeography and Dr. Crozier participated with Dr. Doug Waites in an interterm on Coastal Processes for a class from Birmingham Southern College. The spring term featured a selected topic in physiology course offered by Dr. Hopkins (8 graduate students). There was also a full seminar series arranged by Dr. Stout (Table 2).

John Dindo with part-time assistance from Dr. Crozier, Dana West and Jenny Cook, managed to host over 1,000 students from 25 schools, including field trips from the University of Alabama, Auburn University, University of South Alabama, Tuskegee University and one junior college. In addition, four in-service workshops were held for the South Alabama Regional In-Service Center at USA and a faculty development seminar conducted for the biology instructors from the junior colleges.

The summer program enrollment was down by 13% (Table 3) but was very successful in terms of productivity. Dr. Stout coordinated the student research symposium at the end and it was the best in several years (Table 4).

Table 1.

## LIBRARY STATISTICS - October 1, 1985 - September 30, 1986

<b>BOOKS:</b>

Table 2. Seminar Series

- March 27 Dr. Judy Stout. Biological impacts of the application of seafood wastewater to coastal marshes.
- April 3 Dr. Will Schroeder. Shelf and deepwater circulation in the Goli, including biological implications.
- April 10 John Valentine. The physiological and reproductive ecology of two species of burrowing brittlestars in an estuarine habitat. A Dissertation Propectus.
- April 17 Dr. Skip Lazauski. (Ala. Marine Resources Lab). Alabama's marine recreational creel survey. Methods, findings and conclusion.
- April 24 Mike Lanouette. The use of remotely operated underwater vehicles with emphasis on the Dauphin Island Sea Lab's up coming unit.
- May 1 Dr. Tom Hopkins. Some interactive speculation on benthic zoogeography in the Carribean Gulf of Mexico region.
- May 7 Jenny Cook. Zonation of vascular plants within salt pans in marshes. A Thesis Propectus.
- May 15 Fishery Research Branch, Food and Drug Administration, Dauphin Island. An overview of aquaculture research. A. Dr. Steve Plakas. Fate and disposition of tetracycline in catfish. B. Dr. Merrill McPhearson. Antibiotic resistant bacteria in catfish ponds.
- May 22 Steve Heath. (Ala. Marine Resources Lab). Shrimp management in Alabama.
- May 29 Mark Freeberg (National Marine Fish. Serv., Pascagoula, MS). The Fishline Information Network: An overview.

Research Advisor - Dr. Judy Stout

"Sediment Plume Morphology Main Pass, Mobile, Alabama"

Randy Abston - Geology Graduate  
University of Alabama  
Research Advisor - Dr. William Schroeder

POSTER SESSION ONLY

"Thermal Regime Characteristics of Coastal Alabama Waters"

Michael Davis - Sea Grant Undergraduate Summer Fellowship  
University of Alabama  
Research Advisor - Dr. William Schroeder

Discovery Hall Program and the Environmental Studies Center co-sponsored two elementary teacher workshops and one PACE (gifted) teachers workshop this year. These workshops have been quite successful (Appendix 2). A major emphasis is on collecting specimens that the teachers will be able to use year after year and children of all ages will have a better understanding of the oceans and how it can effect them. The lab benefits from this through future utilization by these classroom teachers.

The summer program was highly successful with 26 students participating in the single four week program offered this year. Three students were scholarship winners funded through the Sea Lab and Mississippi-Alabama Sea Grant Consortium. Students came from Tennessee, Mississippi, Illinois, Massachusetts and Texas with 75% of them coming from Alabama.

A very successful faculty retreat for Mobile College was hosted by the Sea Lab, in August. Discovery Hall personnel led field trips for the 75 participants which included a collecton/observation trip aboard the A. E. Verrill.

#### GRADUATE STUDIES

There are 12 graduate students currently "enrolled", six at the University of Alabama, three at the University of South Alabama, two at Auburn and one at the University of Alabama at Birmingham. Six other students have expressed a strong interest in programs, 3 at the University of Alabama and 3 at USA.

Additional contributions of \$6,000 each has been received from the Shell and Mobil Oil Foundations, bringing the total to \$45,936 including the interest earned. At this time MESC has partially supported five graduate students without drawing on the principal of the fund. A full

fellowship has been awarded to Mr. John Valentine, a Ph.D. candidate at the University of Alabama and this fund should begin to dwindle.

It is interesting to note that MESC provided \$6986, to the University of Alabama students (5), \$3175 to Auburn students (1), \$1718 to UAB students (1) and \$1583 to USA students (2). This total represents precisely 1/3 of the total support of 9 graduate students.

## RESEARCH

### EXTRAMURAL:

Dr. Hopkins' study on the natural history of speckled trout was not renewed by the Alabama Research Institute so this project terminated this summer.

It has almost become dogma among fisherman and scientists that seagrass beds are the preferred habitat of all life stages of spotted seatrout. Alabama lacks the extensive seagrass meadows of other coastal states, possessing only about 1,000 acres of seagrasses in brackish and marine environments. The limitation of this habitat, combined with a growing concern on the part of fishermen and resource managers that populations of spotted seatrout are declining, prompted a detailed examination of the role of seagrass beds in the trophic ecology of Alabama populations of spotted seatrout.

Simply stated, the ultimate goal of the study is to answer the question "Are grassbeds trophically important to spotted seatrout?" Several factors, however, complicate what seems to be a simple question. Most fish eat different food items at different food items at different ages and the possibility exists that a grassbed might be critically important to a species only at a particular life stage. Livingston (1982) has developed a technique using cluster analysis of prey similarity among

size classes to identify the stages of changes in food preference with increasing size. Each growth stage in the feeding progression is known as an ontogenetic trophic unit (OTU) and is based on examination of gut contents of a range of size classes.

A second factor to be considered is seasonal movement of spotted seatrout within their range. Brackish or marine grassbeds may be utilized for feeding only at certain times of the year. Therefore the question of trophic importance of grassbeds to spotted seatrout can be best answered by developing a matrix defined by months as column headings and OTU's as row headings. Data, preferably with confidence intervals, indicating the similarity of spotted seatrout diet and food available in seagrass beds would fill the array. Thus, our question is both asked and answered for each OTU/month combination.

Field sampling to assess available food at 4 experimental sites within coastal grassbeds as well as at 4 unvegetated control sites began in June and has continued on a monthly basis to date. Preliminary evaluation of sampling methodologies reveals that all are adequate to capture the small crustaceans and fish which make up the seatrout diet. Identification and quantification of these organisms is in progress.

The EPA-funded study of seafood wastewater disposal in marshes was completed by Dr. Stout. Her results indicated that the high marshes could assimilate reasonable levels of wastewater. The volumes produced by a community like Bayou La Batre probably cannot be handled in an economically feasible manner, but the procedure could be useful for the isolated processor who cannot physically hook up to a sewer system.

Dr. Schroeder is continuing his work on transport processes and sediment distribution east of the Mississippi Delta with his colleagues at LSU. Mr. Randy Abston, a graduate student in the Department of Geology at

UAT, is responsible for the review and synthesis of the historical data dealing with sediment distribution patterns. Mr. Abston plans to conduct a research project associated with sediment dispersal off coastal Alabama for his Masters thesis. To date this cooperative research effort has produced one poster paper for a national meeting, one manuscript submitted to an international journal and is presently preparing a second poster paper and two additional manuscripts are being prepared. Funding for the second year effort looks very promising from both the Louisiana and Mississippi-Alabama Sea Grant Programs.

The Weeks Bay Estuarine Sanctuary has provided an exciting vehicle for an expanded research effort from the Sea Lab. Drs. Stout, Schroeder, Hopkins and Marion, with John Dindo have all received funding for projects addressing baseline levels of wetlands, nutrients and indicator species as well as the hydrographic description of the bay.

John Dindo has received modest support from the state non-game program for his doctoral work in the Cat Island heronry. This is an exciting biological site and may be the cornerstone to a larger effort. Ornithologists from other areas are beginning to notice our program, one has expressed a desire to teach and perhaps spend a sabbatical here.

ADECA has funded a review of the old CAB data base and Drs. Hopkins, Heck and Crozier are all providing queries to the system to evaluate its utility. Randy Horton has already produced significant material in response to these requests using the IBM PC-AT, and its DB III and BMDP software.

Mike Dardeau has continued to work with the cystic fibrosis researchers at UAB and his curiosity about the natural history of the sipunculid worm resulted in a proposal to the Florida non-game program

which was declined but will be pursued intramurally and with UAB support. Dr. Cline (UAB) continued his work with maintaining populations of the worm. They have learned that the indicator cells may be obtained repeatedly from the worms without jeopardizing the mucus assay procedure. Population maintenance will be the immediate objective of the DISL effort and facilities are being designed to accomodate the worms.

#### EDUCATIONAL:

There has been a recurring suggestion for some years that MESC could most effectively influence lower education by infusing marine units into various levels of the existing science curriculum. This effort has been resurrected by a request from ADECA to assist them in raising local awareness levels with regard to coastal resource issues and use conflicts. An example was prepared and a proposal funded for the production of several units.

In a effort to upgrade the offerings in Discovery Hall, John Dindo prepared proposals for computer capability support from Tandy (Radio Shack) and IBM. These proposals were declined as were last year's but Dr. Heck will become involved in the preparation of future efforts and this submission will be renewed.

#### INTRAMURAL:

As a result of efforts to prepare a coherent approach to the EPSCoR proposal Dr. Stout generated a real initiative in assessing the role and function of grassbeds in state waters. This effort currently involves a couple of graduate students and has been joined by Dr. Heck.

Dr. Crozier has continued the monitoring of beach morphology on Dauphin Island and Perdido Key. The research protocols are being modified to reflect management applications and discussions are underway with ADECA

and the Baldwin County Coastal Program for some funding. Beach response to low energy wave climate and "baseline" conditions were established at 14 monitoring points this summer.

John Dindo has maintained the programmatic interest in the "artificial" reefs of the offshore area. There seems to be a new initiative in this area and he has submitted a proposal to the Gulf Coast Conservation Association for design and fabrication of FADs (Fish Aggregating Devices).

The most intriguing work being pursued in-house revolves around the investigation of the relic shorelines and natural "hard-bottom" areas found offshore by John Dindo and Dr. Schroeder. Although well known to local fisherman, existence of these areas is not acknowledged in the scientific literature. Two geologists from UAT, Drs. Al Shultz and Joe Benson, have joined in the research effort and are providing detailed analysis of the rocks obtained from a number of sampling sites. To date the preliminary interpretation of the thin section x-ray diffraction and SEM results indicate that the environmental settings in which these rocks were laid down range from open water shallow-marine to strongly reducing fresh water back bays and lagoons. The geochemistry of samples from these areas and the origin and history of these features may be the most exciting science to come out of the lab to date.

The living communities of the area have not been systematically examined either. These "hard bottom" studies will be the focus of a renewed continental shelf research program using the A. E. Verrill, involving the resident faculty and any campus scientists who wish to participate. The activities at the various sites will be enhanced by the availability of an experimental Remote Operated Vehicle (ROV) designed and

fabricated by Mike Lanouette, the Marine Technician at the Lab. The unit currently houses a black and white TV and is capable of operation in 100' of water.

#### BUDGET:

There have been three distinct, yet interacting, budgetary problems. The most obvious is the financing of the hurricane rehabilitation. A pattern has emerged which confirms our reluctant observation following Frederic that hurricanes have done more to maintain the physical plant than the state of Alabama. Within its own envelope, the issue is manageable if the state does provide the 25% match to the state emergency management group. All information available indicates that to be the case when the exact amount is established. The cash flow and debts associated with the project have affected this year's budget. The bank loan was retired in September, partially as the result of \$150,000 "advance" from the Finance Dept. against the eventual state match and final FEMA settlement. The second problem area is the severe shortfall in budgeted income. A large portion of the reduced enrollment may also be hurricane-related but neither FEMA nor insurance will help us with that issue. A number of other intangibles have been suggested as well, including student finances and the oil glut impact on geology majors. Of more concern is the drastic shortfall in extramural research funding as salary release, overhead and vessel lease. This reflects national trends, the recent efforts to administer the Tuscaloosa faculty research from campus and the delays in getting the Verrill ready to go to sea.

The reduction of the state appropriation from \$830,000 to \$755,000 is particularly distressing in light of the momentum achieved in the last two years, the '85 hurricane season notwithstanding. New faculty have been

identified, several new research initiatives have been developed, the coastal research vessel is ready to go to sea, and the entire mood at the laboratory was distinctly positive.

The initial efforts to reduce the '86/'87 budget involved a 10% line item cut, holding the Verrill at the dock, freezing salaries at the '85/86 levels and examining the projected income. MESC has historically managed to bring in \$150,000-\$200,000 in extramural funds from all sources (Fig. 4). The salary freeze and 10% O & M cut still presented an extramural deficit of \$215,652. By extracting the one-time renovation costs on the Verrill, this figure was reduced to \$175,652 which is within the scope of a good operating year. We have, however, seen less extramural support this year than in the recent past. Until impact of new research faculty can be assessed and some protocol established for overhead recovery associated with U. of Alabama faculty it seems most prudent to approach next year's budget in a fiscally conservative mode.

The most recent budget is somewhat encouraging only in the decision to lay-up the smaller research vessel (Deborah B.) rather than the Verrill. This saves less in the short term but provides much more flexibility in teaching and research performance. The large vessel is also considered more marketable in the commercial research field.

Within MESC faculty research it has been agreed that overhead (@ 65% S & W) will return to O & M, 80% of salary release recovery will go to a research fund to be administered by the faculty as a whole while 20% will go to an account designated for the generating Principal Investigator as incentive/seed money.

We have discussed a similar assignment of "interest on checking" funds to the development of the business office. This would seem to be

appropriate just as interest earned on the graduate funds is returned for that purpose.

The final financial statement (Table 5) is satisfactory only in the conclusion that we spent no more than we took in over the '85-'86 year. That means that we have shown adequate fiscal responsibility but deferred maintenance and stalled research are the unavoidable consequence of this dubiously successful stewardship.

Research Advisor - Dr. William Schroeder

APPENDIX II

June 27, 1986

Mr. John Dindo  
P.O. Box 369-370  
Discovery Hall Program  
Dauphin Island, AL 36528

Dear Mr. Dindo,

I would like to express my gratitude for letting me participate in the Discovery Hall Program. Since my participation last summer, two events have occurred which have shown me the true quality of the Discovery Hall Program. First, on the science portion of the ACT test I scored a 34 out of a possible 35. This score put me into the 99 percentile of all the people who took the ACT test. Also during my participation in the selection weekend of Operation Raleigh I mentioned the Discovery Hall Program to the instructors and they seemed impressed. Operation Raleigh is a program sponsored by Prince Charles which allows young people to participate in various activities around the world. Though I was not accepted, it was because of my age and not my attributes.

I know that my participation in the Discovery Hall Program helped me achieve the success I did, and I would like to thank you again for offering this program to students such as myself.

Sincerely,

  
John Howell

Mr. John Dindo  
Discovery Hall  
Box 369-370  
Dauphin Island, Al. 36528

Dear Mr. Dindo,

MARINE SCIENTIST DO KNOW HOW TO CARRY ON!!!!

Thank you for a wonderful day Saturday June 7, 1986. I never expected to come away from my first day of summer vacation wishing I was back in the classroom with the children! Your enthusiasm is catching. Your depth of knowledge and expertise is persuasive and compelling. Please continue to invigorate and infect more of us so that we can pass on a greater appreciation and respect for our marine environment to our future generation.

Please let me know if you conduct future workshops.

Sincerely,

*Fran Lowry*  
Fran Lowry  
Kindergarten Teacher
